

Assignment

**** AI Pair Programming**

***Use github copilot to :

1) Generate code from natural language prompts.

2) For 3 use cases: code explanation, code refactoring, code review / improvement

*****Lovable AI :**

Build a complete HTML + JavaScript frontend for student registration and login using Supabase.

Requirements:

1. Users (students) should be able to ****sign up and log in**** using ****email/password**** with Supabase Auth.
2. On ****signup****, collect ``name`` and ``email`` from the form and:
 - Create the Auth user
 - Insert ``name``, ``email``, and the Supabase Auth UID into the ``students`` table.
3. On ****login****, fetch and display the student's ``name`` and ``email`` from the ``students`` table using their UID.
4. Show a welcome message with the student's name and email after login.
5. Include a ****logout**** button.
6. Use ****Supabase client**** with the ****anon/public key**** and ****URL****.
7. The ``students`` table schema is:
 - ``id`` UUID PRIMARY KEY
 - ``name`` TEXT
 - ``email`` TEXT
 - ``created_at`` TIMESTAMP

8. The app should have:

- A clean and responsive UI (use basic CSS or Bootstrap if needed)
- Signup/Login forms
- A student dashboard after login that shows their stored details

9. Handle latency/delays gracefully using loading states and error handling.

10. Use only **HTML, vanilla JavaScript**, and Supabase JS client (no frameworks).

Generate the full code (HTML + JS in one file) with everything working.
